The *Miry Bay* property was shut-in in June 2022. The Company's pipelines have been shut-in as a result of specific pipeline leaks. Two high-risk lines contributed to the shut-in of the greater system.

After examination of the gathering system, it is recommended that these two high-risk lines be suspended and capped. This would isolate these two lines from the main group lines associated gathering system and remaining wells.

Once the identified lines have been isolated, the balance of the wells and gathering system can return to service with approval from the Saskatchewan Ministry of Energy and Resources. It is proposed that the pipelines be excavated where they enter the main 8" group line location at 15-06-022-18W3 and 13-07-022-18W3. Once exposed, the high-risk laterals will be cut, cleaned out via 'pigging', and capped, leaving them in a state to be easily and properly abandoned in the future. On the main gathering line, a very short stub will remain to enable a cap to be welded on and restore pressure integrity. The operations would adhere to proper CSA Z662 procedures to retain the integrity of the group line. It is estimated that the operations would enable approximately 49 wells and the facility at *Miry Bay* to be returned to production at an expected rate of between 850 Mcf/d to 1.0 MMcf/d of natural gas.

Snipe Lake Property

Township 23-24, Range 19-21 W3

In the *Snipe Lake* area, the Company holds a 100% working interest in 239 wells.

The *Snipe Lake* property is currently shut-in.

Miscellaneous Property

Township 21-23, Range 18-19 W3

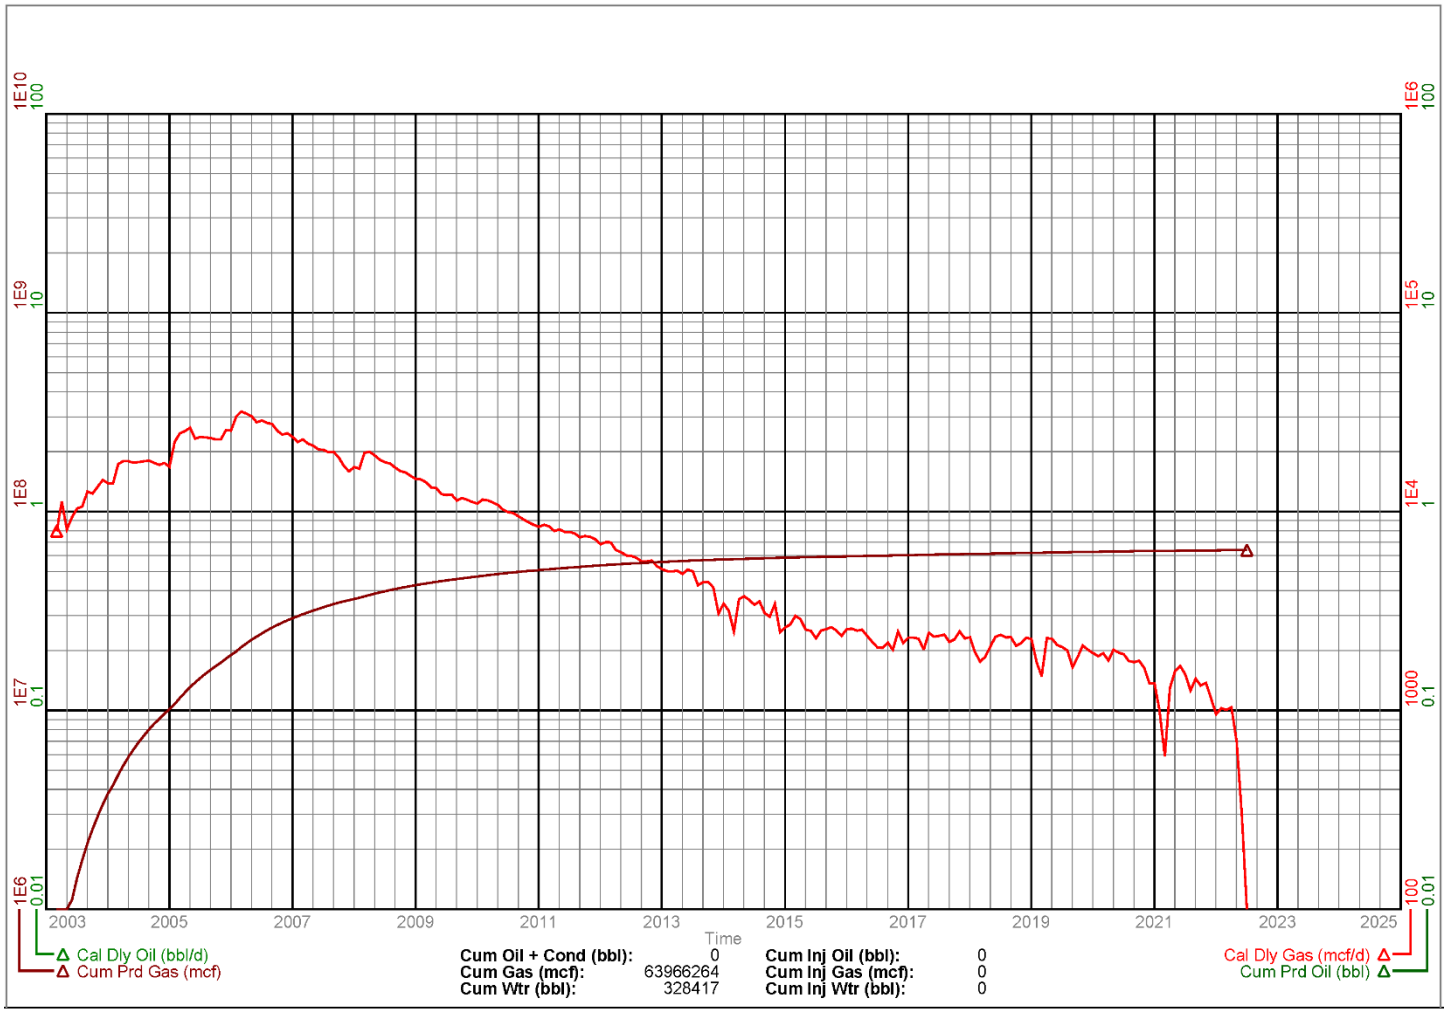

In the *Miry Bay* area, the Company holds a 100% working interest in 134 wells.

The *Miry Bay* property was shut-in in June 2022. The Company's pipelines have been shut-in as a result of specific pipeline leaks. Two high-risk lines contributed to the shut-in of the greater system. After examination of the gathering system, it is recommended that these two high-risk lines be suspended and capped. This would isolate these two lines from the main group lines associated gathering system and remaining wells.

Once the identified lines have been isolated, the balance of the wells and gathering system can return to service with approval from the Saskatchewan Ministry of Energy and Resources. It is proposed that the pipelines be excavated where they enter the main 8" group line location at 15-06-022-18W3 and 13-07-022-18W3. Once exposed, the high-risk laterals will be cut, cleaned out via 'pigging', and capped, leaving them in a state to be easily and properly abandoned in the future. On the main gathering line, a very short stub will remain to enable a cap to be welded on and restore pressure integrity. The operations would adhere to proper CSA Z662 procedures to retain the integrity of the group line. It is estimated that the operations would enable approximately 49 wells and the facility at *Miry Bay* to be returned to production at an expected rate of between 850 Mcf/d to 1.0 MMcf/d of natural gas.
